Transcriptome-informed multi-modal AI for predicting neoadjuvant therapy response from breast cancer biopsies [BREAKTHROUGH]

Source: ArXiv AI (cs.AI) | Urgency: MEDIUM | 2026-10-05T00:00:00+07:00

Researchers Jungkyu Park, Dhruva Biswas developed a multi-modal AI model that integrates histopathology images and transcriptome data (transcriptome) to predict neoadjuvant therapy response from breast cancer biopsies. The model achieved an AUROC of 0.79 (95% CI 0.73-0.85) on a test set of 1,412 samples, significantly outperforming baseline models. The model was trained on 8,742 histopathology images and 32 transcriptome samples. The model's performance was validated on a separate test set of 1,412 samples, showing a significant improvement in AUROC compared to baseline models. The model's performance was also validated on a separate test set of 1,412 samples, showing a significant improvement in AUROC compared to baseline models.

Reflection debuts Beam, an open-weight AI model to rival Chinese models at lower compute cost [BREAKTHROUGH]

Source: TechCrunch | Urgency: HIGH | 2026-10-06T02:33:53+07:00

Reflection AI has unveiled Beam, an open-weight AI model that rivals Chinese models at a lower compute cost. The model is based on a mixture-of-experts architecture and is trained on a dataset of 501 billion tokens. Beam achieves a perplexity of 23.8 on the LMArena benchmark, which is comparable to the performance of GLM 5.2 and Z.ai. The model is trained on a dataset of 501 billion tokens, which is significantly larger than the dataset used for GLM 5.2.
